Ornamental Features

Wavy Leafed Sea Lavender features showy plumes of white flowers with violet calyces at the ends of the stems from late summer to mid fall. The flowers are excellent for cutting. Its twisted narrow leaves remain green in color throughout the season. The fruit is not ornamentally significant.

Landscape Attributes

Wavy Leafed Sea Lavender is a dense herbaceous perennial with tall flower stalks held atop a low mound of foliage. Its medium texture blends into the garden, but can always be balanced by a couple of finer or coarser plants for an effective composition.

This is a relatively low maintenance plant, and is best cleaned up in early spring before it resumes active growth for the season. It is a good choice for attracting butterflies to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

Wavy Leafed Sea Lavender is recommended for the following landscape applications;

- Mass Planting
- General Garden Use

Planting & Growing

Wavy Leafed Sea Lavender will grow to be about 18 inches tall at maturity, with a spread of 12 inches. When grown in masses or used as a bedding plant, individual plants should be spaced approximately 8 inches apart. Its foliage tends to remain dense right to the ground, not requiring facer plants in front. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 15 years.

This plant should only be grown in full sunlight. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is not particular as to soil pH, but grows best in sandy soils, and is able to handle environmental salt. It is somewhat tolerant of urban pollution. This species is not originally from North America.
